

The background of the image is a photograph of a city skyline, likely Dubai, featuring numerous tall skyscrapers. In the foreground, there is a body of water, and along the shoreline, several construction cranes and industrial structures are visible, suggesting a port or industrial zone. The sky is clear and blue.

EASYFLEX

KANWAL INDUSTRIAL CORPORATION

Easyflex is invested in design and manufacturing of
Flexible Piping Components | Vibration, Seismic & Sound Isolation

Our Engineers also specialize in
Piping Stress Analysis | Shock Isolation Design | Seismic Design & Engineering

We are committed to business process improvements in the engineering sector with a focus on automating Selection and Design technology. Our global strategic partnerships, enable us to create and deliver world class products for our customers.

INERTIA BASE FRAMES

Inertia bases are designed to support reciprocating equipment such as pumps, chillers, generators and air handling equipment.

In conjunction with vibration mountings and or seismic isolators, they reduce the transmission of noise and vibration from equipment to building structures and associated pipework.

SELECTION

DESIGN ENGINEERING

SEISMIC ISOLATION

VIBRATION ISOLATION

DESIGN CRITERIA

INERTIA BASE

1. Make & Model of Pump
2. LxBxH of Pump
3. Type of Pump
4. HP & RPM of Motor
5. Installation Location
6. Size of Concrete Plinth

Inertia bases provide suitable attachment for vibration isolators and reduce motion of equipment during start-up and shut-down.

Help to reduce rocking by lowering the equipment centre of gravity.

Introduction

Inertia bases and vibration mountings are designed to reduce the transmission of noise and vibration from equipment to building structures and associated pipework. When installed with rubber bellows or stainless steel hose & pump connectors they provide an ideal vibration and noise isolation solution. Inertia bases are designed to support reciprocating equipment such as pumps, chillers, generators and air handling equipment. The inertia base is manufactured from a fully welded carbon steel zinc frame fitted with vibration mounts. The inertia base are specifically designed and engineered to receive poured concrete which can be supplied empty, pre-filled with concrete or pre-filled with Pumps fitted. It is by adding this mass and by lowering equipment centre of gravity it is installed under that enables the inertia base to provide a stable support. This is particularly important for equipment which exhibits high out-of-balance forces and are top-heavy such as pumps. The concrete base enables a reduction in motion from pump start up and minimises the effect of unequal load distribution. Inertia bases are not only manufactured to suit the equipment for which it's designed to support but can also be sized to suit site conditions. This is particularly advantageous in tight restrictive areas such as building services plant rooms. All Bases are supplied with Anti-Vibration Mounts designed to support the combined load of Pump, Concrete Base and Water and retain a 50% overcapacity. When installing rubber bellows to a pump that is supported by inertia base the rubber bellows should be supplied with tie bars. Tied units are designed to stop the bellows from elongating and prevent the pressure thrust being transmitted on to the pumps and associated pipework. Easyflex rubber flexible connectors are supplied with threaded tie rods whose primary function is to maintain the supplied length of the rubber bellows under pressure while permitting only lateral deflection.

Easyflex Inertia Base come in several standard sizes as listed in our catalogue. However, these bases can also be manufactured to any size and specifications, even for heavier and more complex vibration isolation problems, where viscous damping may also be required. For frame lengths greater than 2400 mm we would normally recommend 6 isolators or more for exceptionally large bases.

Examples of equipment requiring Inertia Base are as follows:

- Reciprocating Compressors
- Diesel Generating Sets
- Engine / Dynamometer Test Rigs
- Refrigeration Plants
- Pumps (Particularly Belt Driven Types)

Features

- Fully welded steel construction with integral concrete reinforcement fixed at 40 mm above bottom of frame.
- Recessed height reducing corner brackets designed to accept standard Easyflex type EFOS open spring mountings or EFESI Mounts.
- Range of standard size frames available in three thicknesses 150, 200, 300 & 350 mm. Frame thickness not less than $L/12$ where "L" is the longest side of the frame as per ASHRAE.
- Finished with a single coat of red oxide primer on external surface only.
- Fabricated using formed steel channel (EFIB). Optionally available in structural steel channel construction.
- Available for any equipment dimension. Rectangular shape supplied as standard. T-shape offered where it is required to support elbows of horizontal split casing pumps on the base itself.
- Reinforced with 12mm OD welded-in steel rebar each way, at approximately 150mm spacing.
- Provided with height saving isolator fixing brackets. External brackets are supplied as standard. Recessed brackets are offered in case of space constraints.
- Supplied together with Easyflex isolator. Selection of mount type/models forms part of the EFIB design process; to provide a complete vibration isolation solution. Frames are compatible with Open, Cased and Restrained mounts.

Notes

Frame weights include concrete density at 2400 Kg/m³ and mounting selections are based on 4 mountings per base allowing 50% additional weight for the equipment to be supported. Nominal 25 mm deflection type EFOS (Open Spring Isolators) have been listed, however the exact deflection will vary depending on the applied load.

When ordering, bases should be specified as follows: EFIB 150 - 600 x 900 Other Size. Type and Thickness required and plan dimensions commencing with smallest length. Mountings should also be listed e.g. "EFOS25/100-BLUE"

Important

The equipment should be located on the base such that the load is evenly distributed over the 4 mountings.

Equipment and ancillary parts should not overhang frame and hold down bolts must not be at a distance less than 100 mm from the outer edge of the base.

All the connections to the equipment should incorporate flexible sections and pipework etc. must be independently supported.

Concrete Plinth if any, should be at least 200mm more than the size of base in all directions. In case of installation of snubbers it should be increased to 300mm.

Compliance - Easyflex Inertia Bases are designed according to ASHRAE guidelines.

Ordering Information Required

- Equipment Model / Make
- HP / RPM of Motor
- Static Weight of equipment
- Operating / Dynamic weight of equipment
- Outside Dimensions L x B x H
- Concrete Plinth Y/N
- Height / Space Constraint if any
- Required Deflection of Spring (25mm / 50mm)
- Location - Ground | Roof | Basement

- Due to policy of continual improvement, the specifications are subject to change without prior notice.
- Measurements are subject to 5% tolerance.
- To achieve good results do not over load fitting more than designed parameters as per drawing / catalogue.

Design Features

- Unique expanding rubber and fixing of spring which also provides high frequency attenuation.
- Nominal 20, 25 & 50 mm deflection colour coded springs with 50% overload capacity.
- Can be bolted to supporting structure or free standing on 6mm thick ribbed rubber pad.
- Fully height adjustable.
- Zinc plated metals.
- No snubbing gives maximum efficiency.

Isolation Efficiency at Typical Machine Speeds

M/C Speed (rpm)	EFFICIENCY %		
	15mm DEFL	25mm DEFL	50mm DEFL
300	do not use	34.0	75.2
500	68.7	83.3	92.3
750	88.1	93.2	96.7
1000	93.7	96.3	98.2
1200	95.5	97.4	98.7
1500	97.3	98.4	99.2
1750	98.0	99.8	99.4
2000	98.5	99.1	99.5

This unique range of open spring mounting uses an integral rubber end fixing of the spring which sets them apart from all other designs. Loose springs and plates are now history and high frequency and noise attenuation is provided regardless of whether rubber seating pad is used or not.

Originally designed for use with type IPF Inertia Pouring Frames, the EFOS Mountings are now widely used to isolate vibration from every conceivable type of rotating and reciprocating machine. Some examples being air handling units, axial and centrifugal fans, low level pipe work, ductwork, condensing units, pumps, generating sets, chillers, etc. Where control of transient motion is required open spring mountings can be used in conjunction with our Viscous Dampers Type EFVD.

Size	LOAD RANGE (kg)	NOMINAL DEFLECTION (mm)
EFOSB	10-100	20
EFOS25	30-2300	25
EFOS50	100-1300	50

This above figures are theoretical values only based on the vertical natural frequency of the spring system assuming an infinitely stiff structural supports. The effects of high frequency spring coil resonances on low frequency performance are also ignored.

Compliance - Springs designed according to BS 1726 (Part 1) and recommendations made by SAE (US) and ASHRAE

- Due to policy of continual improvement, the specifications are subject to change without prior notice.
- Measurements are subject to 5% tolerance, Load and Deflection subject to 10% tolerance.
- To achieve good sound suppression do not over load fitting.

Compliance - Springs designed according to BS 1726 (Part 1) and recommendations made by SAE (US) and ASHRAE

- Due to policy of continual improvement, the specifications are subject to change without prior notice.
- Measurements are subject to 5% tolerance, Load and Deflection subject to 10% tolerance.
- To achieve good sound suppression do not over load fitting.

1. The inertia base frame without isolators should be laid with the internal mesh closest to the floor on a polythene sheet or similar material. This should be a minimum of 100 mm larger on all sides than the inertia base frame with a thickness of 500 to 1000 microns, in order to facilitate base separation once the concrete has been poured and cured. It is important that the frame be positioned on a level surface in order that the polythene provides an effective seal around the perimeter of the frame preventing percolation of concrete when being poured. Concrete plinth or Housekeeping Pad if any should be at least 150mm more than the size of inertia base in all directions so that isolators can be easily installed.

2. The concrete mix infill with a compressive strength of at least 16 to 20 N/mm² (C16/20) can then be poured into the frame. It is important the reinforcement mesh is not damaged and no air pockets exist around corners and edges. Water to be poured on Concrete at least 4 times in a day to ensure strong curing.
3. When the concrete has cured sufficiently (minimum of 72 hours) the equipment or machine can then be securely fixed to the upper surface using suitable expanding bolt type fixings. Note: it is important that the centre of gravity of the equipment or machine is positioned vertically above the centre of gravity of the inertia Base frame.
4. The frame should now be lifted using a minimum of four hydraulic jacks (more are required for large sectional frames) positioned under each frame bracket and intermediate positions if required. The jacks must be raised simultaneously to ensure that the frame remains as level as possible during the lift. Once clear of the floor the polythene sheeting must be removed and the frame lifted to a height so that the selected isolators can be positioned under the supporting brackets as shown. Wood or steel blocks correctly sized to fit the gap under the frame must then be positioned evenly around the frame to provide a level and solid support. Once this has been achieved the jacks can be removed.

5. The selected isolators can now be installed and the top screws adjusted or shimmed to the underside of the supporting brackets. The hydraulic jacks can now be repositioned and raised sufficiently only to remove the blocks. The jacks can then be lowered and removed, whereupon the isolators will take the full load of the equipment and inertia base weight. Further adjustment of the isolators may be necessary in order to achieve a level installation and required clearance beneath the frame (see relative isolator installation instructions). It is important that all connections to the isolated equipment be flexible in order to prevent a short circuit or transmission of vibration to the surrounding equipment or structure.

Please contact our Technical Department at the address below if you have any problems relating to installation or selection.

Building Codes in many areas require components to be capable of resisting forces created during a Seismic Event.

Resilient Snubbers used while installation can limit the motion experienced by equipment and ensure it remains in place.

Easyflex Seismic Snubber series is suitable for 250 Kg to 11500 Kg Point Load.

PUMPS

Poured with **Concrete** and supported by **Easyflex Noise & Vibration Isolators**, **Inertia Base Frames** are floating foundations for **Pumps** and are totally isolated from the structure due to Air Gap.
